

I'm a solo developer seeking an independent react native expo developer with recent experience using the sip.js library and webrtc to support making and receiving VoIP audio calls from a mobile app. You MUST be experienced with sip.js and webrtc in an Expo native (not a WebView) view. Work should be completed before September 8.

I have a react native expo mobile app that compiles as a development build and runs on a physical iPhone. The app allows the phone to become an extension on a private phone system that includes an existing SIP and PBX server running asterisk.

EXISTING FUNCTIONALITY (see corresponding views below):

- 1. The Status is initially "Idle" and changes to reflect the state of the SIP connection as the user interacts with the app (i.e. Idle, Starting SIP, Registering, Registered, Prepare to call [extension number], Calling, Ringing, Connected)
- 2. When the Register button is pressed, the app connects to an existing SIP server (running asterisk) and REGISTERS successfully with appropriate updates to the Status field.
- 3. When an extension number is entered and the Call button is pressed, the Status field is updated.

		
1. App's initial view.	2. After pressing the Register button.	3. After entering extension "99" and pressing the Call button.

NEW FUNCTIONALITY (what you will build): When the Call button is pressed, the app must use SIP INVITE to place a call to the extension number entered in the text field. The Status field should be updated as the call setup progresses. If extension "99" is called successfully, the user will hear a female voice say "ninety nine" and a male voice say "goodbye", after which the server will end the call.

Required:

- 1. Assume the app is always active in the foreground.
- 2. The app must use sip.js for SIP signalling over websockets.
- 3. The app must use a free library that furnishes WebRTC for audio flow with no charges for calls.
- 4. Must NOT use a Webview component to furnish webRTC.
- 5. Source code must compile as a react native expo development build.
- 6. App must run on a physical Apple iPhone running iOS 12+.
- 7. No refactoring of existing code unless it's necessary to implement the new calling functionality.
- 8. I will authorize you as a collaborator on my github project where you will create a fork for your work.
- 9. Meetings should take place between 8:00 am ET and 8:00 pm ET US using my Zoom for screen sharing.
